## Example Children's Hospital - Neurology (FICTIONAL)

### Neurology Consultation and Neuropsychological Summary - Page 1 of 2

Name: Kai Sample  DOB: 11/11/2019  Date of Report: 07/22/2026

Examiner: Alex Placeholder, M.D., Pediatric Neurology

History: Kai has drug-resistant epilepsy that began at age 3, now diagnosed as Lennox-Gastaut syndrome. He has tonic and atonic seizures several times a week despite two medications.

Neuropsychological testing (Wechsler Intelligence Scale for Children, Fifth Edition; Vineland-3): Full Scale IQ 58, Adaptive Behavior Composite 60. Results show mild intellectual disability alongside his epilepsy.

Diagnoses: Epilepsy (Lennox-Gastaut syndrome); Intellectual Disability, mild.

Plan: consider ketogenic diet and vagus nerve stimulator; supervision during bathing and swimming; seizure plan at school.
